Constructing a Bullet Graph in R

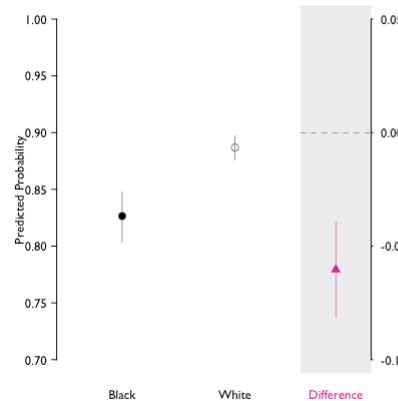

Exploring Data using Table Plots in R

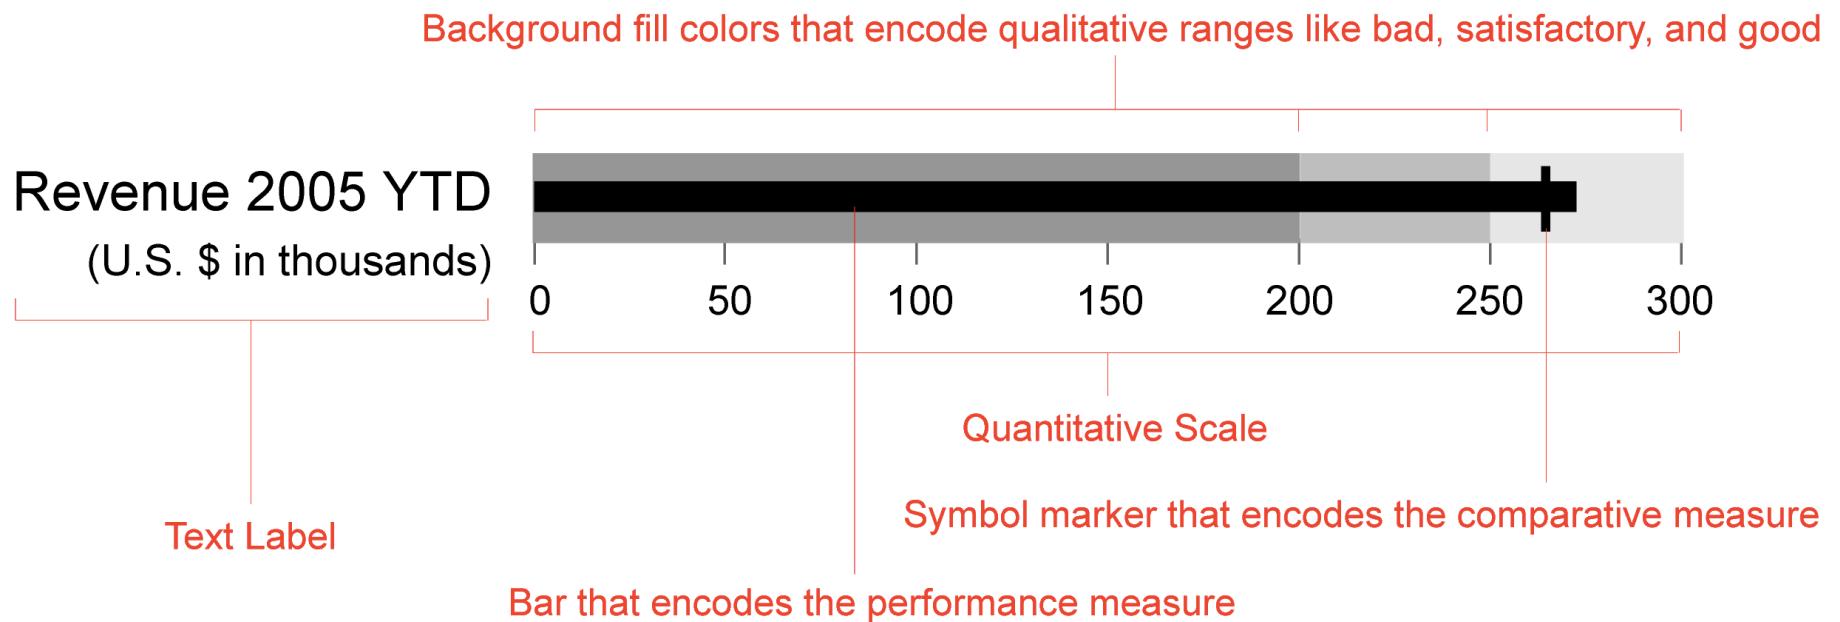

Constructing a Joy Plot Map in R

Visualizing Statistical Models in R

How Do I Construct A Bullet Graph Using R?

How Do I Construct A Bullet Graph Using R?

Let's think about it:

1. You need one or several [bars](#)
2. You need background [color areas](#) for a qualitative judgment
3. You need an additional [plot symbol](#) for the comparative measure
4. And a [scale](#) and [label](#) of course.

All of these ingredients can be easily built in R.

How Do I Construct A Bullet Graph Using R?

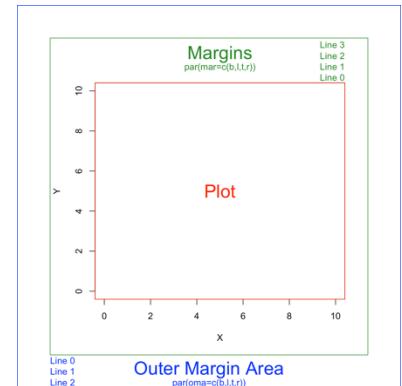

Let's first start with just one bar.

```
measure <- 7
standard <- 6.8

par(mar=c(3, 8, 2, 2), oma=c(13, 1, 13, 1), yaxs="i")

plot(0, 0, xlim=c(0, 10), ylim=c(.45, .55), pch="", ann=F, axes=F)

axis(1)
```

This will just set up an empty plot region and the scale.

How Do I Construct A Bullet Graph Using R?

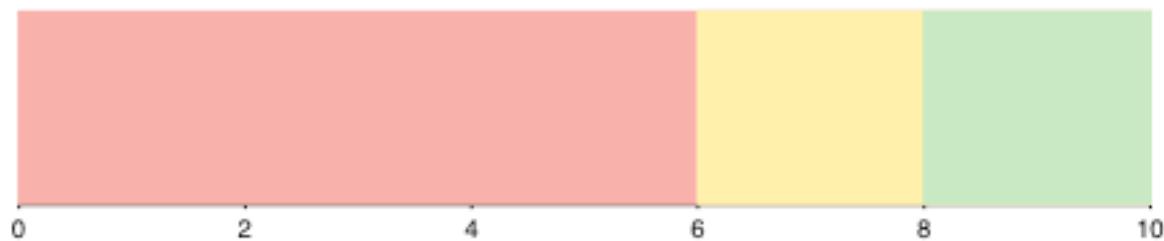

How Do I Construct A Bullet Graph Using R?

Now let's first add the qualitative color regions.

```
rect(0, .45, 10, .55, col="red", border="red")
rect(6, .45, 10, .55, col="yellow", border="yellow")
rect(8, .45, 10, .55, col="green", border="green")
```

How Do I Construct A Bullet Graph Using R?

How Do I Construct A Bullet Graph Using R?

Now add the bar

```
segments(0, .5, measure, .5, lwd=20, lend=1)
```

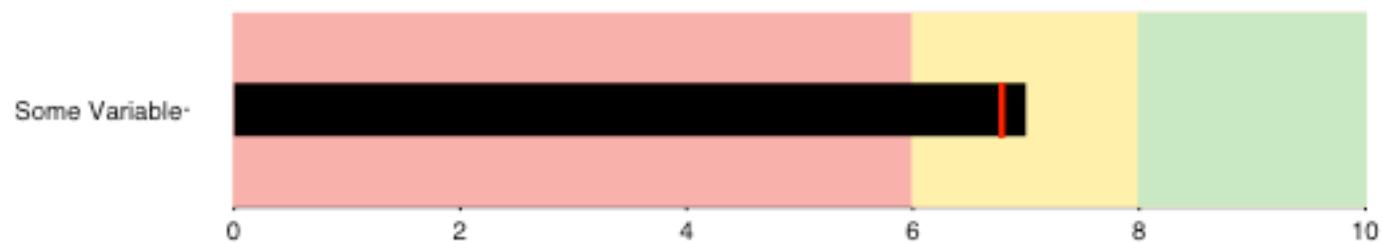

the comparative marker

```
points(standard, .5, pch="|", col="red", cex=3, lwd=10)
```

and the label

```
axis(2, at=.5, label="Some Variable")
```

How Do I Construct A Bullet Graph Using R?

How Do I Construct A Bullet Graph Using R?

Now let's do multiple bars!

```
dat <- c(27, 34, 22, 7)

par(mar=c(3,8,2,3), oma=c(4, 1, 4, 1), yaxs="i")

p <- barplot(dat, horiz=T, space=4, border=F, col="black", ylim=c(0, 22),
xlim=c(0, 40), axes=F)

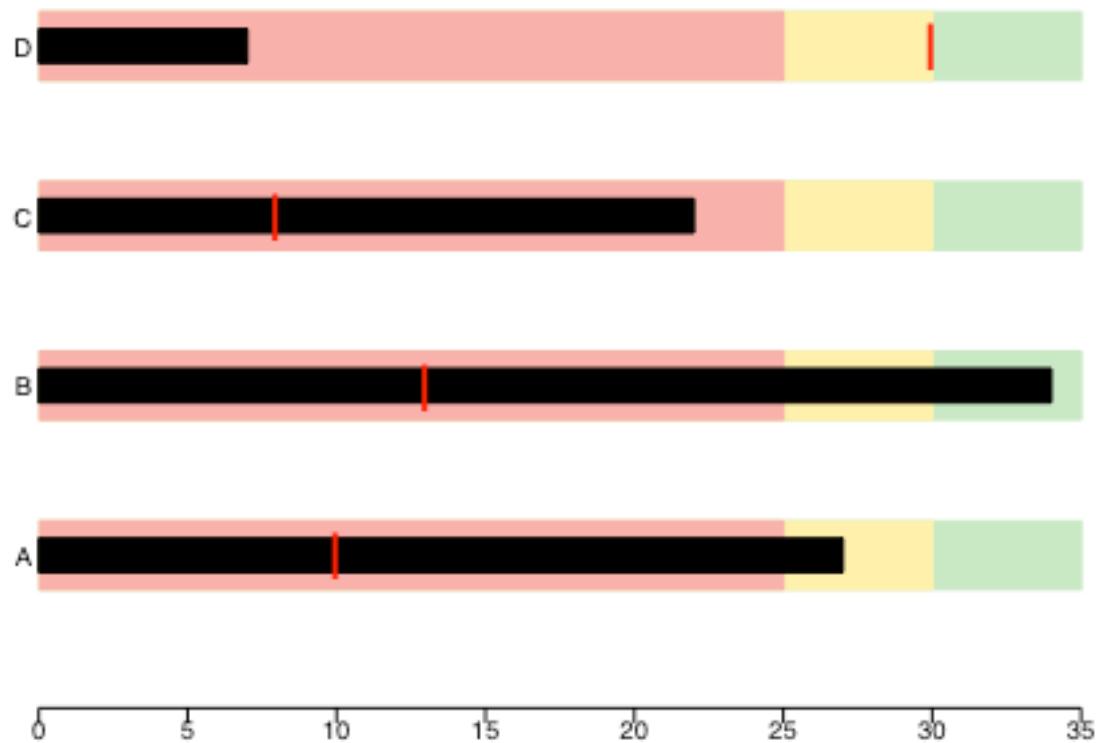

for(i in 1:4) {
  rect(0, p[i]-1, 35, p[i]+1, col="red", border="red")
  rect(0, p[i]-1, 30, p[i]+1, col="yellow", border="yellow")
  rect(0, p[i]-1, 25, p[i]+1, col="green", border="green")
}

barplot(dat, horiz=T, space=4, border="black", col="black", ylim=c(0, 22),
axes=F, add=T, names.arg=c("A", "B", "C", "D"))

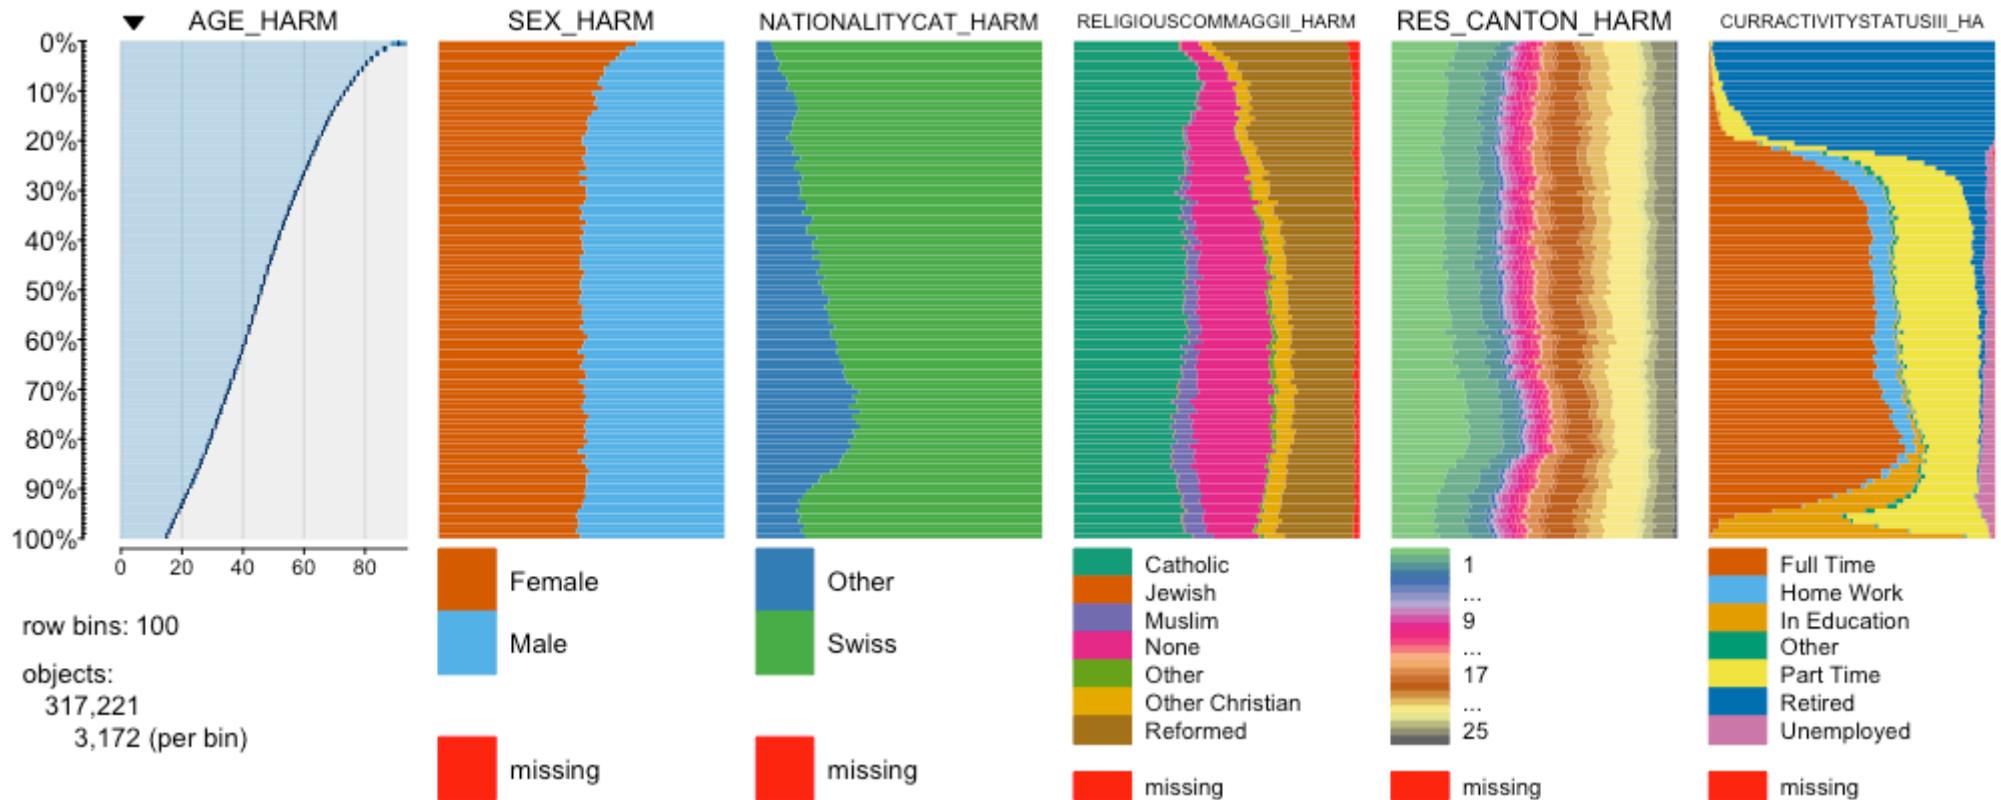

points(c(10, 13, 8, 30), p, pch="|", cex=2.5, lwd=8, col="red")

axis(1, at=seq(0, 35, 5), label=seq(0, 35, 5))
```

How Do I Construct A Bullet Graph Using R?

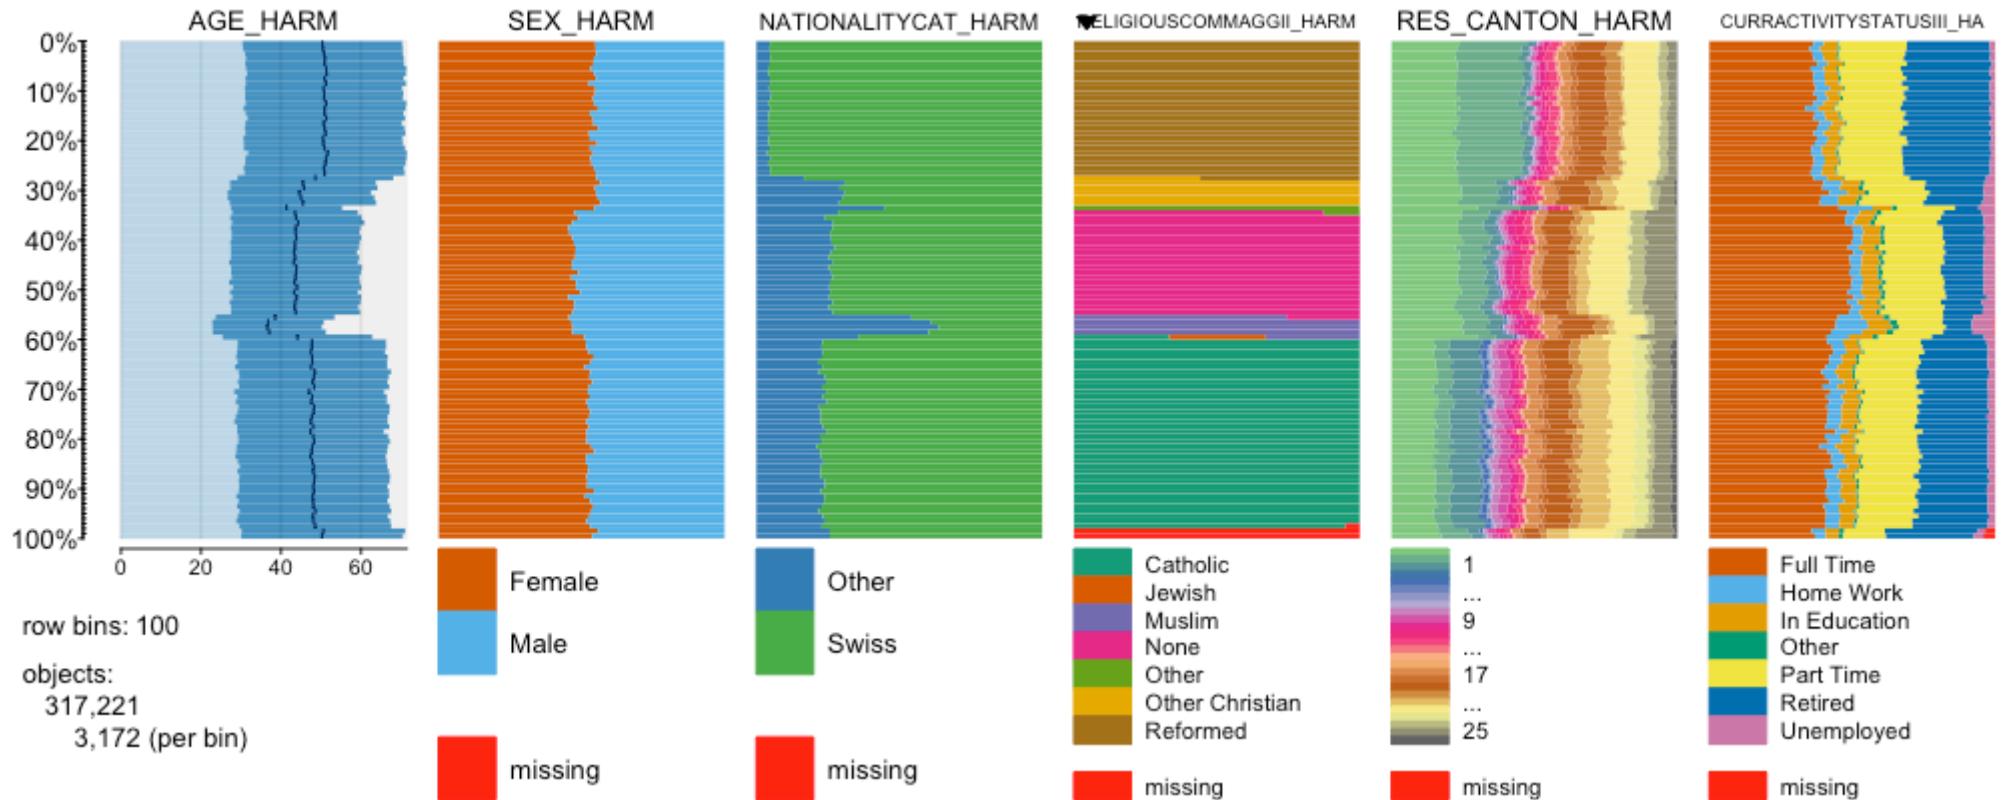

Exploratory Visualization Using Table Plots

```
library(tabplot)
tableplot(data, sortCol=AGE_HARM)
```

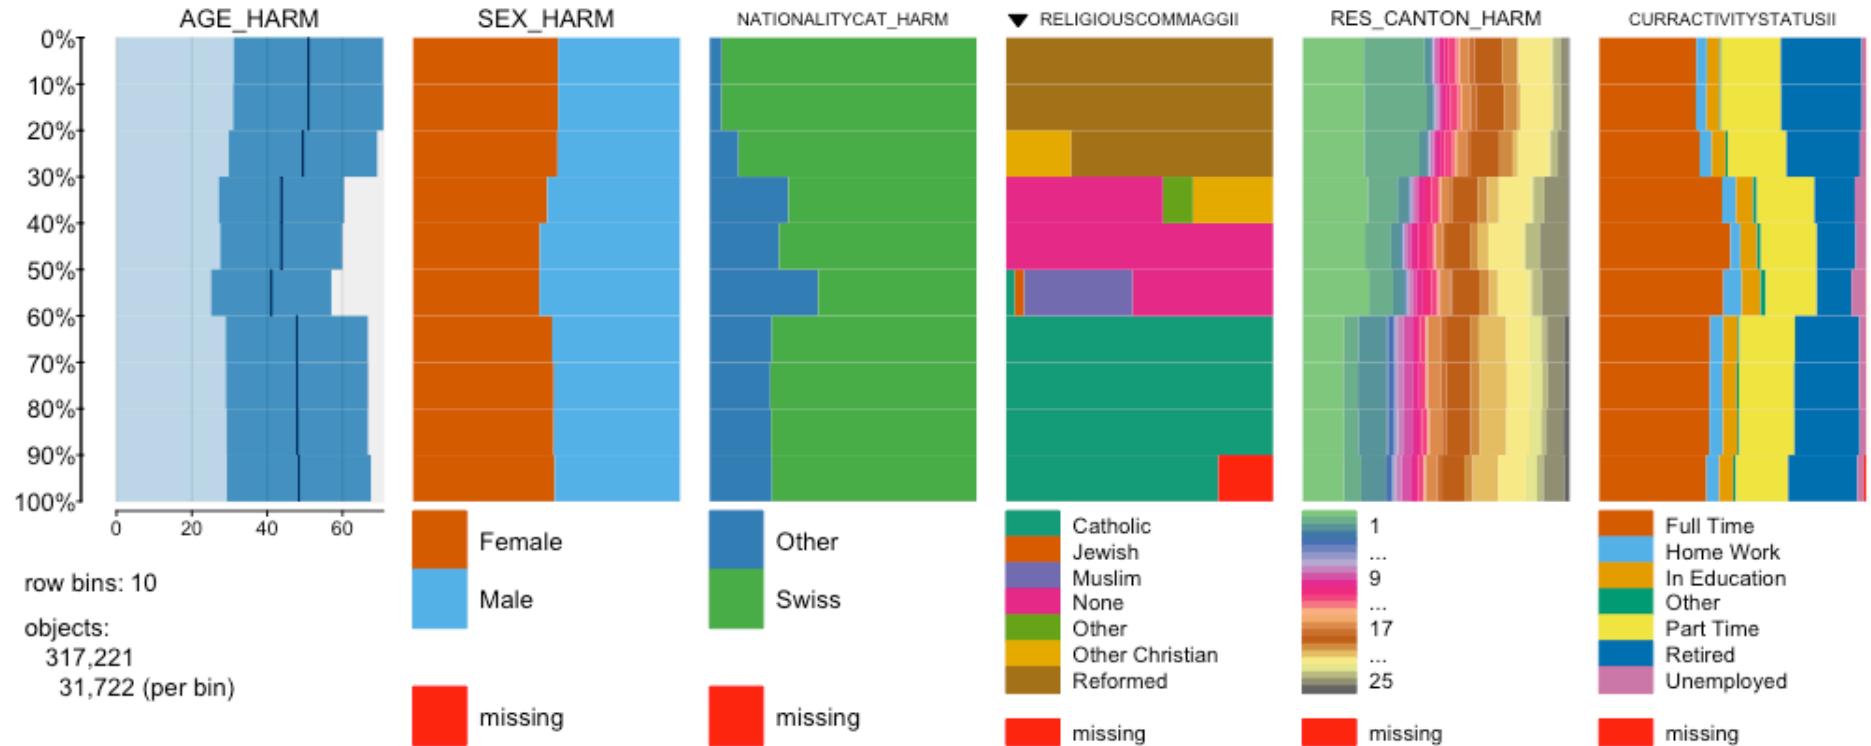

Exploratory Visualization Using Table Plots

Sort by religious group

```
tableplot(data, sortCol=RELIGIOUSCOMMAGGI_HARM)
```

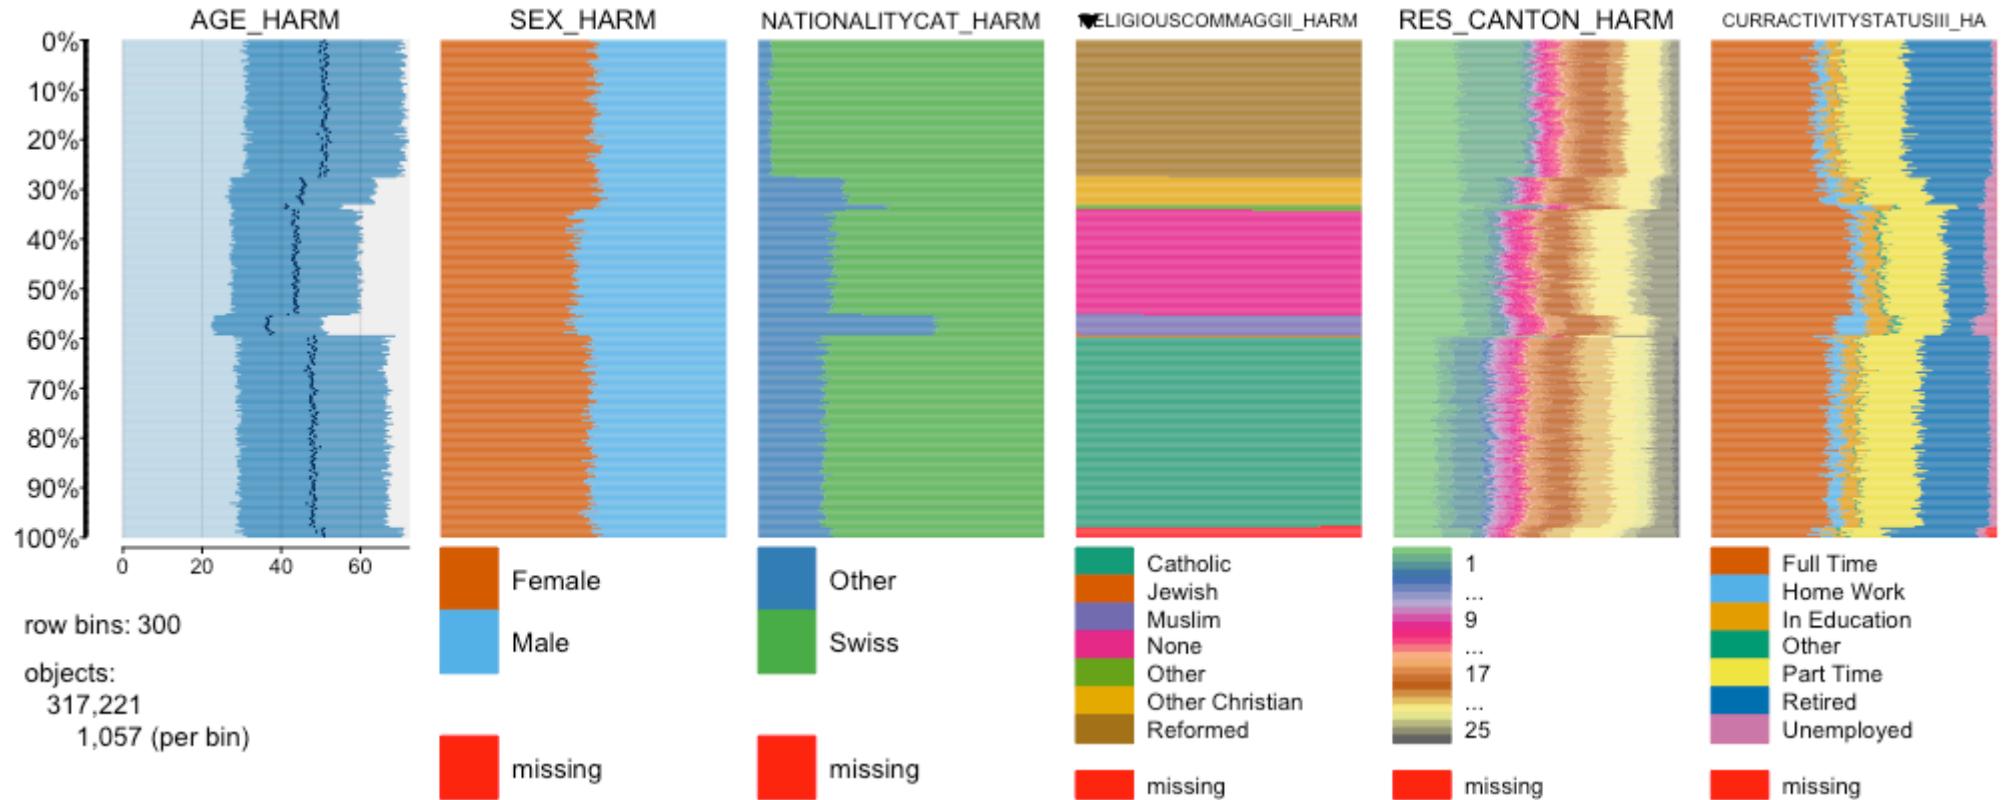

Exploratory Visualization Using Table Plots

Decrease number of bins: more smoothing.

```
tableplot(data, sortCol=RELIGIOUSCOMMAGGI_HARM, nBins=10)
```

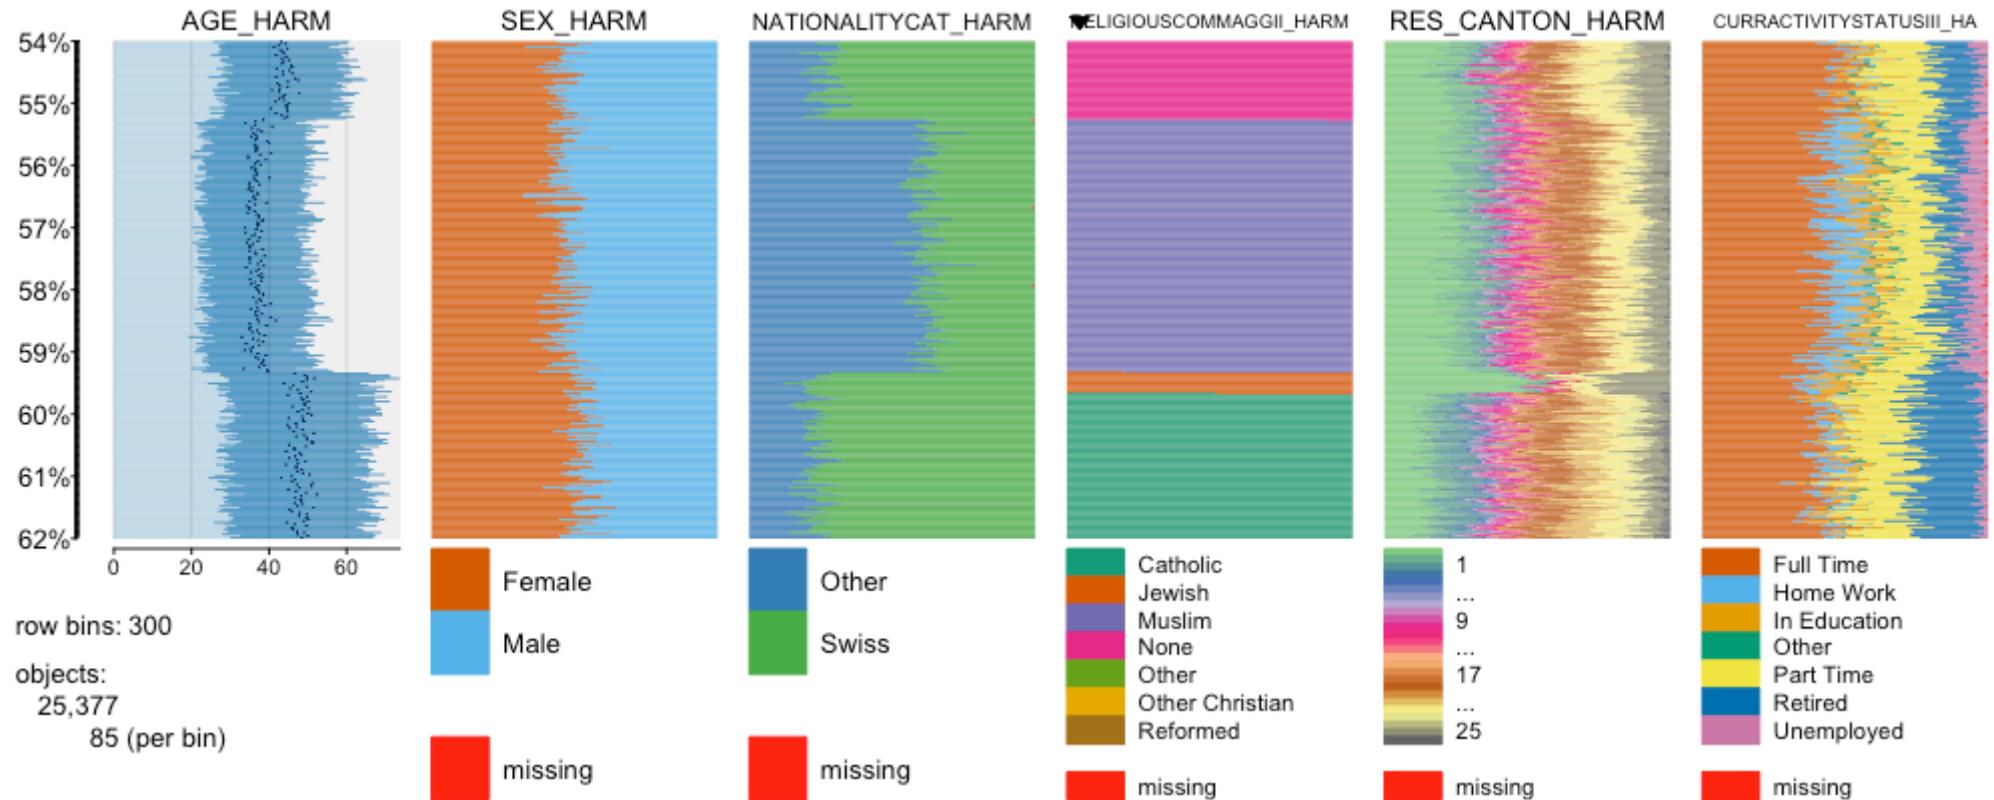

Exploratory Visualization Using Table Plots

Increase number of bins: more variation and detail.

```
tableplot(data, sortCol=RELIGIOUSCOMMAGGI_HARM, nBins=300)
```

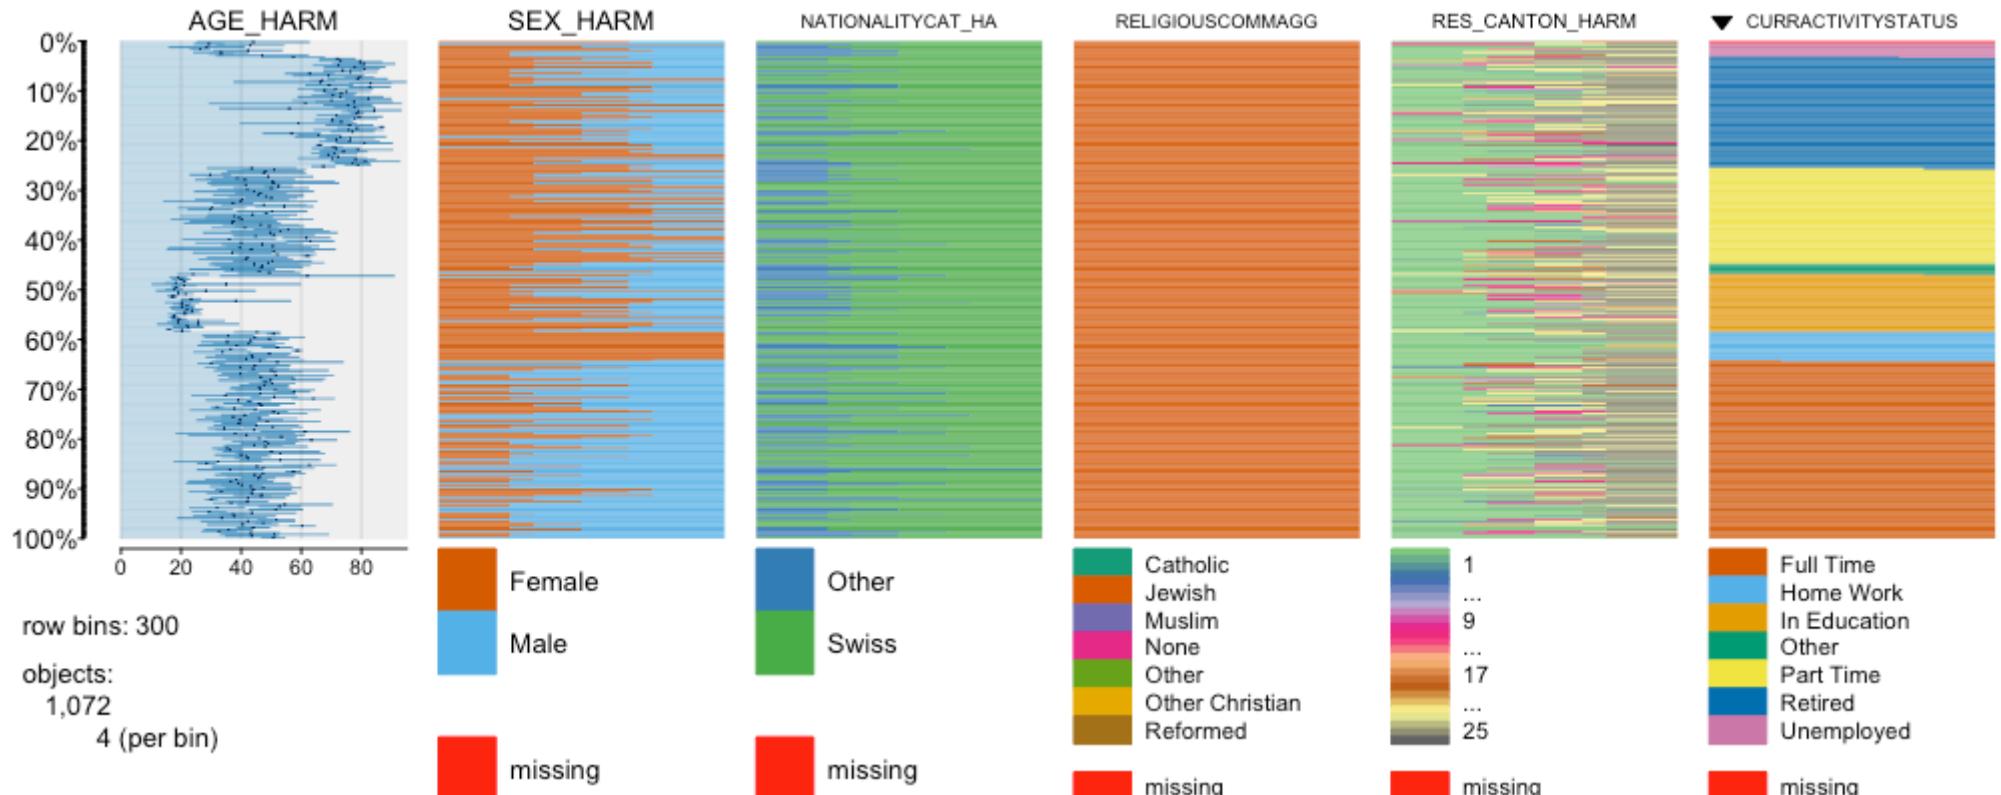

Exploratory Visualization Using Table Plots

Zoom in.

```
tableplot(data, sortCol=RELIGIOUSCOMMAGGI_HARM, from=54, to=62, nBins=300)
```

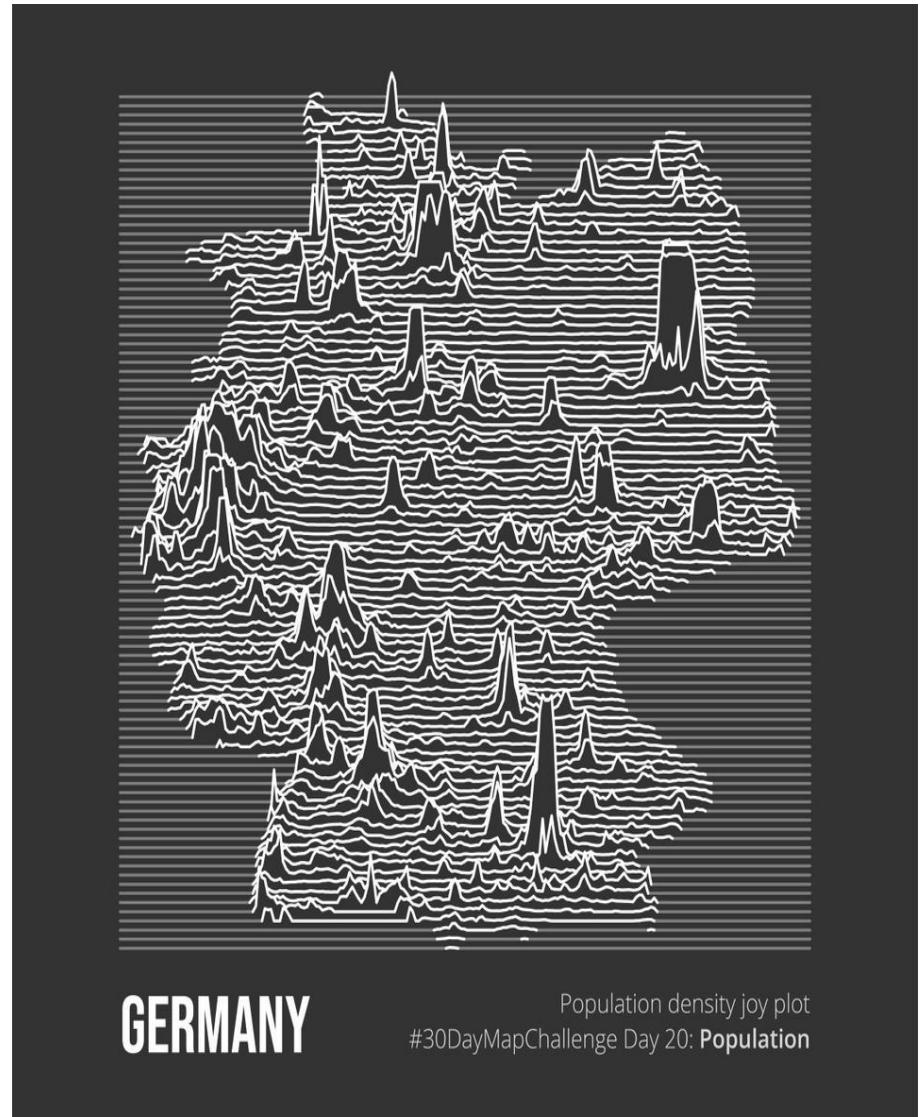

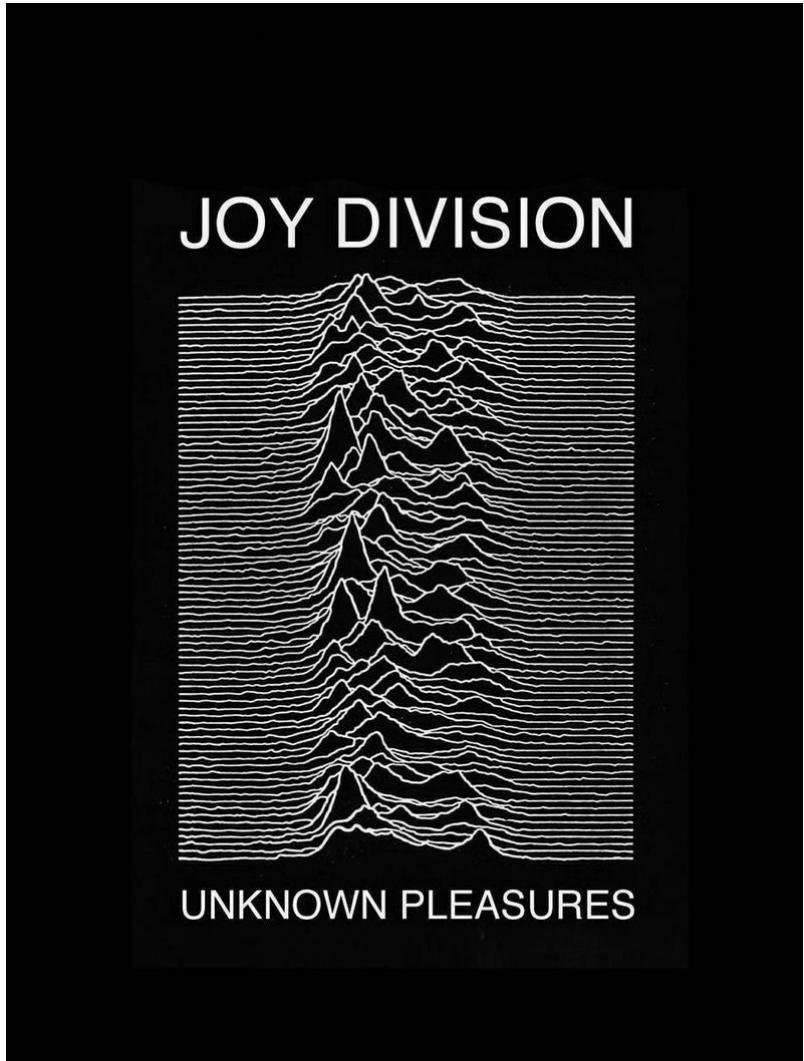

Exploratory Visualization Using Table Plots

Filter and focus.

```
tableplot(data, sortCol=CURRACTIVITYSTATUSIII_HARM,
subset=RELIGIOUSCOMMAGGI_HARM=="Jewish", nBins=300)
```

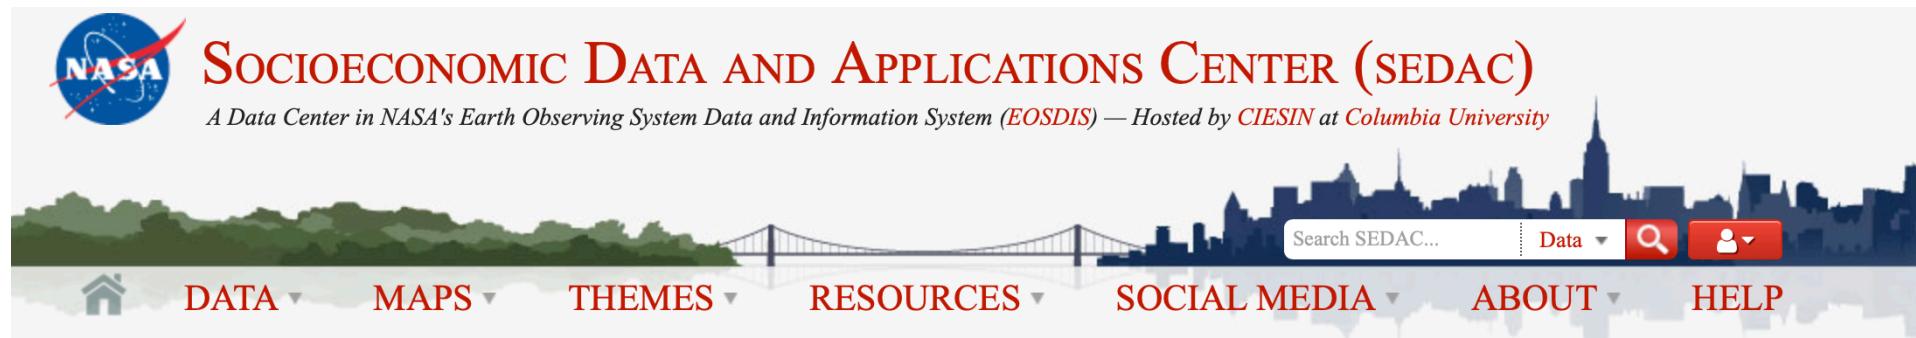

How Do I Make a „Joy Plot Map“ in R?

How Do I Make a „Joy Plot Map“ in R?

Biggest Issue: Data

→ Need population density along with longitude and latitude

Ingredients?

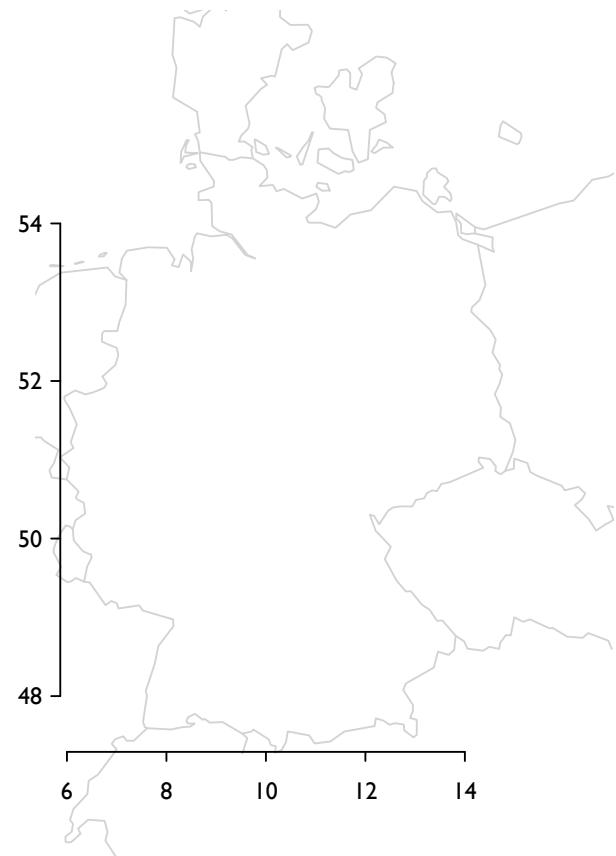

- really just many lines of population densities!
- placement is a bit tricky

How Do I Make a „Joy Plot Map“ in R?

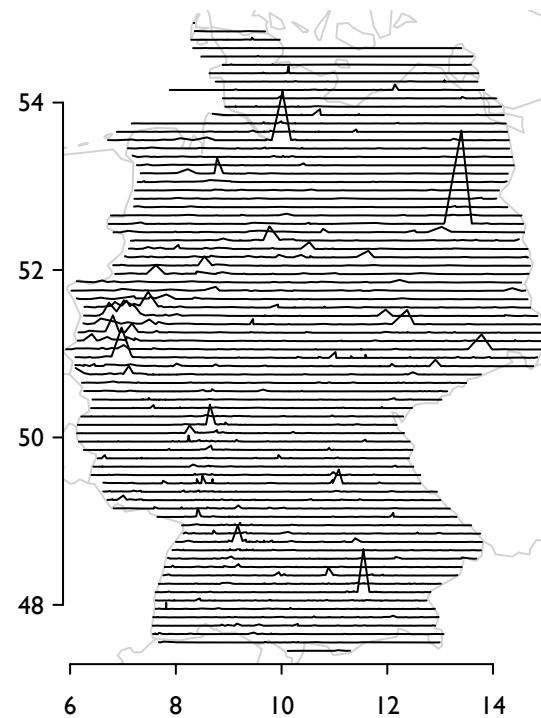

```
library(maps)  
map()
```

```
map(xlim=c(5.924, 14.988),  
     ylim=c(47.37,55.02),  
     col="lightgrey")  
  
axis(1)  
axis(2)
```

```
for(i in seq(47, 55, by=.1)) {  
  
  ord <-  
  order(dat$INSIDE_X[dat$INSIDE_Y>i &  
  dat$INSIDE_Y<=i+.1])  
  
  lines(dat$INSIDE_X[dat$INSIDE_Y>i &  
  dat$INSIDE_Y<=i+.1][ord],  
  
        dat$UN_2020_E[dat$INSIDE_Y>i &  
        dat$INSIDE_Y<=i+.1][ord]/3000000+i+  
        .05)  
  
}
```

```
par(bg="black")

plot(0,0, pch="", xlim=c(5.924,
14.988), ylim=c(47.37 , 60),
axes=F, ann=F)

for(i in seq(47, 55, by=.1)) {

  ord <-
order(dat$INSIDE_X[dat$INSIDE_Y>i &
dat$INSIDE_Y<=i+.1])

  lines(dat$INSIDE_X[dat$INSIDE_Y>i &
dat$INSIDE_Y<=i+.1][ord],
dat$UN_2020_E[dat$INSIDE_Y>i &
dat$INSIDE_Y<=i+.1][ord]/500000+i+.
05, col=rgb(1,1,1,.5))

}
```
